torch.utils.data.DataLoader

Until now, we have dealt with image sets that could fit in memory, and we manipulated them as regular tensors, e.g.

However, large sets do not fit in memory, and samples have to be constantly loaded during training.

This require a [sophisticated] machinery to parallelize the loading itself, but also the normalization, and data-augmentation operations.

François Fleuret

EE-559 - Deep learning / 7.5. DataLoader and neuro-surgery

2 / 13

PyTorch offers the torch.utils.data.DataLoader object which combines a data-set and a sampling policy to create an iterator over mini-batches.

Standard data-sets are available in torchvision.datasets, and they allow to apply transformations over the images or the labels transparently.

EE-559 – Deep learning / 7.5. DataLoader and neuro-surgery

4 / 13

Given this train_loader, we can now re-write our training procedure with a loop over the mini-batches

```
for e in range(nb_epochs):
    for input, target in iter(train_loader):
        input, target = input.to(device), target.to(device)
        output = model(input)
        loss = criterion(output, target)

        model.zero_grad()
        loss.backward()
        optimizer.step()
```

Note that for data-sets that can fit in memory this is quite inefficient, as they are constantly moved from the CPU to the GPU memory.

Example of neuro-surgery and fine-tuning in PyTorch

François Fleuret

EE-559 – Deep learning / 7.5. DataLoader and neuro-surgery

6 / 13

As an example of re-using a network and fine-tuning it, we will construct a network for CIFAR10 composed of:

- the first layer of an [already trained] AlexNet,
- several resnet blocks,
- a final channel-wise averaging, using nn.AvgPool2d, and
- a final fully connected linear layer nn.Linear.

During training, we keep the AlexNet features frozen for a few epochs. This is done by setting requires_grad of the related Parameters to False.

EE-559 - Deep learning / 7.5. DataLoader and neuro-surgery

```
class ResBlock(nn.Module):
    def __init__(self, nb_channels, kernel_size):
        super(ResBlock, self).__init__()
        self.conv1 = nn.Conv2d(nb_channels, nb_channels, kernel_size,
                               padding = (kernel_size-1)//2)
        self.bn1 = nn.BatchNorm2d(nb_channels)
        self.conv2 = nn.Conv2d(nb_channels, nb_channels, kernel_size,
                               padding = (kernel_size-1)//2)
        self.bn2 = nn.BatchNorm2d(nb_channels)
    def forward(self, x):
        y = self.bn1(self.conv1(x))
        y = F.relu(y)
        y = self.bn2(self.conv2(y))
        y += x
        y = F.relu(y)
        return y
```

```
class Monster(nn.Module):
    def __init__(self, nb_blocks, nb_channels):
        super(Monster, self).__init__()
        nb_alexnet_channels = 64
        alexnet_feature_map_size = 7 # For 32x32 (e.g. CIFAR)
        alexnet = torchvision.models.alexnet(pretrained = True)
        self.features = nn.Sequential(
            alexnet.features[0],
            nn.ReLU(inplace = True)
        )
        self.conv0 = nn.Conv2d(nb_alexnet_channels, nb_channels, kernel_size = 1)
        self.resblocks = nn.Sequential(
            # A bit of fancy Python
            *(ResBlock(nb_channels, kernel_size = 3) for _ in range(nb_blocks))
        self.avg = nn.AvgPool2d(kernel_size = alexnet_feature_map_size)
        self.fc = nn.Linear(nb_channels, 10)
```

```
def freeze_features(self, q):
    for p in self.features.parameters():
        # q = True means that it is frozen and we do NOT need the gradient
        p.requires_grad = not q

def forward(self, x):
    x = self.features(x)
    x = F.relu(self.conv0(x))
    x = self.resblocks(x)
    x = F.relu(self.avg(x))
    x = x.view(x.size(0), -1)
    x = self.fc(x)
    return x
```

```
nb_epochs = 50
nb_blocks, nb_channels = 8, 64
model, criterion = Monster(nb_blocks, nb_channels), nn.CrossEntropyLoss()
model.to(device)
criterion.to(device)
optimizer = torch.optim.Adam(model.parameters(), lr = 1e-2)
for e in range(nb_epochs):
    model.freeze_features(e < nb_epochs // 2)</pre>
    acc_loss = 0.0
    for input, target in iter(train_loader):
        input, target = input.to(device), target.to(device)
        output = model(input)
        loss = criterion(output, target)
        acc_loss += loss.item()
        optimizer.zero_grad()
        loss.backward()
        optimizer.step()
    print(e, acc_loss)
```
